

## Claus Process

For Claus process control is essential to monitor the feed gas and tail gas. Especially the tail gas monitoring is difficult because of sampling system plugging by sulphur. ECM is providing compact low maintenance light reliability systems for both applications.

- H2S and SO monitoring at high sulfur background
- UV spectrometer allows a broad dynamic range eliminating interferences
- Housing allowing installation without protective shelters
- New intake probe design avoiding sulfur to enter the analytical part preventing plugging problems
- Service interval is 30 days!
